### Will clean green hydrogen ever replace gas in Australian homes?

Ron Ben-David 29 April 2022

### A clean future or merely greenwashing? Critics claim Coalition's hydrogen plans are a 'fig leaf' for fossil fuels

By energy reporter Daniel Mercer  
Posted Thu 12 May 2022 at 7:06am

### What about Hydrogen?

Hydrogen is a battery, not an energy source. To make hydrogen with truly zero emissions, you need green electricity. Even if you do it with green electricity anyway, only it squanders more than half of that energy in conversion. In short, hydrogen is electrification, but a roundabout and very inefficient. If we do hydrogen for the majority of the energy economy, it doubles or triples the energy we have to produce. It is an expensive sideshow to the main event: electricity. It's a lot of energy, but let's not get carried away. Beware! There are obvious reasons the gas industry likes to lobby for this idea. Australia is dangerously addicted to the Hydrogen narrative, and we should be more realistic about its role in Australia's future.

## Macroeconomic Analysis Methodology

The macroeconomic analysis methodology combines real or modelled retail energy price ranges with ranges for appliance cost and efficiency.

$$\text{Total Customer Cost} = (\text{Energy Cost} \times \text{Appliance Efficiency}) + (\text{Annualised Appliance Cost} / \text{Annual Energy Use})$$

[Put simply, bill cost per unit of energy amenity plus appliance cost per unit of energy amenity]

Energy cost could either be a reported figure, derived through a bottom-up Whole of System Cost approach as proposed by Frontier Economics, or by a top-down approach of modelling anticipated changes to the breakdown of retail energy costs.

Within the modelling displayed within this presentation, reported retail energy prices for FY2020-21 are considered alongside a top-down model of retail energy price breakdown based upon data from the Australian Energy Regulator (AER) via the formula:

$$\text{Retail Energy Cost}_{\text{net zero}} = \sum(\text{Retail Energy Component Cost}_{\text{FY2020-21}} * \text{Net Zero Energy Scalar})$$

[Put simply, how much net zero energy and infrastructure costs relative to historic costs]
